

Things you may not know about calibration at Endress+Hauser

We offer traceable calibrations of many measurement instruments, including from third-party manufacturers. We can even calibrate devices outside of our product portfolio, such as weighing equipment, and offer same-day turnaround for in-house calibrations.

Our in-house flow calibration rig is accredited by UKAS, proving that it meets the requirements of ISO 17025, the international standard for testing and calibration laboratories. The rigorous auditing process tests the quality and method of the calibration as well as the competency of technicians carrying out the work, the process of creating and storing documentation and the traceability of reference standards.

If your instrument can't be removed from the line, or you need to keep downtime to an absolute minimum, our qualified and experienced Field Service Engineers can carry out a mobile calibration. They can perform adjustments, diagnose faults and recalibrate devices.
